Are you or someone you know taking care of an elderly loved one? How would you like to keep your aging parent(s) in their home longer instead of having them go to an assisted care facility?

**GrandCare System** is a combination of Smart Home Technology, Internet Communications and an affordable investment can allow family and caregivers to assess the wellness and safety of their loved ones through GrandCare Systems.

The system consists of a control unit, monitor (touch screen) and a source of Internet to provide a display of news, weather, pictures, e-mail, games and interactive reminders to your aging parents. Wireless sensors, blood pressure monitors and weight scales provide feedback to help manage activities of daily living and wellness.

Motion sensors can tell you about the general activity levels in the home and alert you to specific events.

- If the fridge is not accessed during mealtime
- If medications are not accessed
- Detect wandering motion (a potential medical symptom)
- Detect excessive motion (too much motion at one sensor could indicate potential problems, falls, etc.)
- Determine if a loved one did not get out of bed in the morning
- Be alerted if door opens at wrong time
- If the front or back door opens during the night
- If the garage door is left open
- If the pill cabinet is not opened at particular times of day
- If the pill cabinet is opened more often than expected
- If the refrigerator isn't opened at meal times

Current Concepts believes that Home Automation is about leveraging technology to simplify and enhance your lifestyle. Trust us to be your source for all your technology needs and get the peace of mind you deserve.
